**Abstract:** In this paper, we present the improved versions of Hardy inequalities for the generalized  $p$ -degenerate subelliptic Heisenberg-Greiner operators. By employing divergence theorem and choosing suitable vector fields, we obtained two types of weighted Hardy inequalities. Furthermore, we show the proof of the best constants by combining with the approximation method. Our results extend the existing results.

**Key words:** generalized  $p$ -degenerate subelliptic Heisenberg-Greiner operators; weighted Hardy inequalities; best constants

近年来, 含权 Hardy 不等式的研究吸引了大量学者的关注<sup>[1-2]</sup>, 在齐次群上获得了一些改进后的 Hardy 不等式<sup>[3-4]</sup>. 针对于广义 Heisenberg-Greiner  $p$ -退化椭圆算子, 文献[5]利用 Picone 恒等式得到一类如下 Hardy 型不等式: 若  $u \in C_0^\infty(\mathbb{R}^{2n+1} \setminus \{(0, 0)\})$ ,  $1 < p < Q$ , 则

作者简介: 王胜军, 教授, 硕士, 主要从事椭圆方程边值问题的研究.

$$\left(\frac{Q-p}{p}\right)^p \int_{\mathbb{R}^{2n+1}} \left(\frac{|z|}{d}\right)^{p(2k-1)} \left(\frac{|u|}{d}\right)^p \leq \int_{\mathbb{R}^{2n+1}} |\nabla_L u|^p \quad (1)$$

其中:  $\nabla_L u, d$  分别为 Heisenberg-Greiner 向量场关于  $u$  的梯度和拟距离;  $Q=2n+2k$  是齐次维数(下文详细介绍). 特别地, 当  $p=2, k=1$  时, (1) 式即为文献[6]中结果. 文献[7]在有界集  $\Omega \subset \mathbb{R}^{2n+1}$  且  $0 \notin \Omega$  上得到了下列 Hardy 不等式: 若  $1 < p < +\infty$ , 则对任意  $u \in D^{1,p}(\Omega)$ , 有

$$\left(\frac{|Q-p|}{p}\right)^p \int_{\Omega} \left(\frac{|z|}{d}\right)^{p(2k-1)} \left(\frac{|u|}{d}\right)^p d\xi \leq \int_{\Omega} |\nabla_L u|^p d\xi \quad (2)$$

其中  $\xi=(x, y, t) \in \mathbb{R}^{2n+1}$ . 进一步, 如果  $0 \in \Omega$ , 则(2)式中常数  $\left(\frac{|Q-p|}{p}\right)^p$  最佳. 对于 Kohn Laplacian 算子, 文献[8]建立了带有余项的 Hardy 不等式: 若  $\Omega \subset \mathbb{H}^n, 0 \in \Omega, p \neq Q$ , 则对于  $u \in D_0^{1,p}(\Omega \setminus \{0\})$ ,  $R \geq R_0$  存在  $M_0 > 0$ , 使得  $\sup_{x \in \Omega} d(x) e^{\frac{1}{M_0}} = R_0 < \infty$ , 有

$$\int_{\Omega} |\nabla_H u|^p dx \geq \left|\frac{Q-p}{p}\right|^p \int_{\Omega} \psi_p \frac{|u|^p}{d^p} dx + \frac{p-1}{2p} \left|\frac{Q-p}{p}\right|^{p-2} \int_{\Omega} \psi_p \frac{|u|^p}{d^p} \left(\ln\left(\frac{R}{d}\right)\right)^{-2} dx \quad (3)$$

而且当  $2 \leq p < Q$  时, 可以得到

$$\sup_{x \in \Omega} d(x) = R_0$$

本文使用类似于文献[9]中的方法, 利用散度定理, 引入一类性质恰当的向量场, 结合逼近的思想, 推广了(1),(2)和(3)式, 得到了广义 Heisenberg-Greiner  $p$ -退化椭圆算子的两类含权 Hardy 不等式, 进一步给出了最佳常数的证明.

## 1 预备知识

广义 Heisenberg-Greiner  $p$ -退化椭圆算子为一类具有高奇性的平方和退化椭圆算子<sup>[10]</sup>, 被更多的学者所关注, 并得到了许多重要的成果<sup>[11-12]</sup>. 其构成向量场(见下文) $X_j, Y_j (j=1, 2, \dots, n)$ 在  $k > 1$  时不满足 Hörmander 有限秩条件, 从而它的亚椭圆性无法由此导出, 增加了研究的难度<sup>[13-14]</sup>. 以下给出广义 Heisenberg-Greiner  $p$ -退化椭圆算子的基本知识.

广义 Heisenberg-Greiner  $p$ -退化椭圆算子形为

$$\mathcal{L}_p u = \operatorname{div}_L (|\nabla_L u|^{p-2} \nabla_L u) \quad (4)$$

其中:  $\nabla_L = (X_1, \dots, X_n, Y_1, \dots, Y_n)$ ,  $\operatorname{div}_L (u_1, \dots, u_{2n}) = \sum_{j=1}^n (X_j u_j + Y_j u_{n+j})$ ,  $p > 1$ , 这里  $X_j = \frac{\partial}{\partial x_j} + 2ky_j |z|^{2k-2} \frac{\partial}{\partial t}$ ,  $Y_j = \frac{\partial}{\partial y_j} - 2kx_j |z|^{2k-2} \frac{\partial}{\partial t}$ ,  $z_j = x_j + \sqrt{-1}y_j \in \mathbb{C}, j=1, 2, \dots, n, t \in \mathbb{R}, k \geq 1$ . 注意到, 当  $p=2, k=1$  时,  $\mathcal{L}_p$  就成为 Heisenberg 群  $\mathbb{H}^n$  上的 Kohn Laplacian 算子  $\Delta_{\mathbb{H}^n}$ <sup>[15]</sup>. 当  $p=2, k=2, 3, \dots$  时,  $\mathcal{L}_p$  就成为 Greiner 算子<sup>[16]</sup>

$$\mathcal{L} = \sum_{j=1}^n (X_j^2 + Y_j^2)$$

设  $\xi=(z, t)=(x, y, t) \in \mathbb{R}^{2n+1}$ , 相应于(4)式中  $\mathcal{L}_p$  的一个自然伸缩为

$$\delta_{\tau}(z, t) = (\tau z, \tau^{2k} t) \quad \tau > 0 \quad (5)$$

与伸缩(5)式相应的齐次维数是  $Q=2n+2k$ . 由(5)式诱导的一个拟距离为

$$d(z, t) = [ |z|^{4k} + t^2 ]^{\frac{1}{4k}} \quad (6)$$

通过(6)式直接计算知道

$$\nabla_L d = \frac{1}{d^{4k-1}} \begin{pmatrix} |z|^{4k-2} x + ty |z|^{2k-2} \\ |z|^{4k-2} y - tx |z|^{2k-2} \end{pmatrix}$$

$$|\nabla_L d|^p = d^{-(2k-1)p} |z|^{(2k-1)p} = \psi_p, \quad \mathcal{L}_p d = \frac{\psi_p}{d} (Q-1) \quad (7)$$

另外, 定义中心在  $\{0\} \in \mathbb{R}^{2n+1}$ , 半径为  $R$  的拟开球为  $B_R(\xi) = \{\xi \in \mathbb{R}^{2n+1} \mid d(\xi) < R\}$ .

令  $C_0^k(\mathbb{R}^{2n+1})$  表示  $C^k(\mathbb{R}^{2n+1})$  中具有紧支集的函数构成的集合,  $D^{1,p}(\Omega) = \{u: \Omega \rightarrow \mathbb{R} \mid u, |\nabla_L u| \in L^p(\Omega)\}$ ,  $D_0^{1,p}(\Omega)$  是  $C_0^\infty(\Omega)$  在范数

$$\|u\|_{D_0^{1,p}} = \left( \int_\Omega |\nabla_L u|^p d\xi \right)^{\frac{1}{p}}$$

下的完备化, 其中:  $\Omega \subset \mathbb{R}^{2n+1}$ ,  $1 < p < \infty$ .

## 2 一类含权 Hardy 不等式

**定理 1** 设  $a, b \in \mathbb{R}$  且  $a \neq Q$ ,  $b > 2-Q$ . 若  $1 < p < \infty$ ,  $\Omega \subset \mathbb{R}^{2n+1}$ ,  $d(\xi)$  在  $\Omega$  上有界, 则对于  $u \in C_0^\infty(\Omega \setminus \{0\})$ , 有

$$\int_\Omega \left( \frac{|z|}{d} \right)^{(b-p)(2k-1)} \frac{|\nabla_L u|^p}{d^{a-p}} d\xi \geq \left| \frac{Q-a}{p} \right|^p \int_\Omega \left( \frac{|z|}{d} \right)^{b(2k-1)} \frac{|u|^p}{d^a} d\xi \quad (8)$$

当  $p \neq Q$ , 有

$$\int_\Omega \frac{|\nabla_L u|^p}{d^p} d\xi \geq \left| \frac{Q-2p}{p} \right|^p \int_\Omega \left( \frac{|z|}{d} \right)^{p(2k-1)} \frac{|u|^p}{d^{2p}} d\xi \quad (9)$$

$$\int_\Omega \left( \frac{|z|}{d} \right)^{-p(2k-1)} |\nabla_L u|^p d\xi \geq \left| \frac{Q-p}{p} \right|^p \int_\Omega \frac{|u|^p}{d^p} d\xi \quad (10)$$

$$\int_\Omega \left( \frac{|z|}{d} \right)^{-2p(2k-1)} \frac{|\nabla_L u|^p}{d^{-p}} d\xi \geq \left| \frac{Q}{p} \right|^p \int_\Omega \left( \frac{|z|}{d} \right)^{-p(2k-1)} |u|^p d\xi \quad (11)$$

当  $0 \in \Omega$ , (8), (9), (10) 和 (11) 式中的常数是最佳的.

**证** 由 (7) 式直接计算得到

$$\operatorname{div}_L (d^{-a+1} |\nabla_L d|^{b-2} \nabla_L d) = (Q-a)d^{-a} |\nabla_L d|^b \quad (12)$$

在  $\Omega$  上, 引入  $C^1$  类向量场

$$H(x, y, t) = C |C|^{p-2} \frac{|\nabla_L d|^{b-2} \nabla_L d}{d^{a-1}}$$

其中  $C = \frac{Q-a}{p}$ . 结合 (12) 式有

$$\begin{aligned} \operatorname{div}_L H &= \operatorname{div}_L (C |C|^{p-2} d^{-(a-1)} |\nabla_L d|^{b-2} \nabla_L d) = p |C|^{p-1} d^{-a} |\nabla_L d|^b \\ |H| &= |C|^{p-1} d^{-a+1} |\nabla_L d|^{b-1} \end{aligned}$$

这样就得到

$$\begin{aligned} \operatorname{div}_L H - (p-1) |\nabla_L d|^{\frac{b-p}{p-1}} d^{\frac{a-p}{p-1}} |H|^{\frac{p-1}{p}} &= \\ p |C|^{p-1} d^{-a} |\nabla_L d|^b - (p-1) |C|^{p-1} d^{\frac{-(a-1)p}{p-1}} |\nabla_L d|^{\frac{(b-1)p}{p-1}} |\nabla_L d|^{\frac{b-p}{p-1}} d^{\frac{a-p}{p-1}} &= \\ |C|^{p-1} d^{-a} |\nabla_L d|^b \end{aligned} \quad (13)$$

而对于  $u \in C_0^\infty(\Omega \setminus \{0\})$ , 有

$$\begin{aligned} \int_\Omega \operatorname{div}_L H |u|^p d\xi &= -p \int_\Omega \langle H, \nabla_L u \rangle |u|^{p-2} u d\xi \leq p \int_\Omega |H| |\nabla_L u| |u|^{p-1} d\xi \leq \\ p \left( \int_\Omega \frac{|\nabla_L d|^{b-p}}{d^{a-p}} |\nabla_L u|^p d\xi \right)^{\frac{1}{p}} \left( \int_\Omega |\nabla_L d|^{\frac{b-p}{p-1}} d^{\frac{a-p}{p-1}} |H|^{\frac{p-1}{p}} |u|^p d\xi \right)^{\frac{p-1}{p}} &\leq \\ \int_\Omega \frac{|\nabla_L d|^{b-p}}{d^{a-p}} |\nabla_L u|^p d\xi + (p-1) \int_\Omega |\nabla_L d|^{\frac{b-p}{p-1}} d^{\frac{a-p}{p-1}} |H|^{\frac{p-1}{p}} |u|^p d\xi \end{aligned}$$

也即

$$\int_{\Omega} \frac{|\nabla_L d|^{b-p}}{d^{a-p}} |\nabla_L u|^p d\xi \geq \int_{\Omega} (\operatorname{div}_L H - (p-1) |\nabla_L d|^{-\frac{b-p}{p-1}} d^{\frac{a-p}{p-1}} |H|^{\frac{p}{p-1}}) |u|^p d\xi \quad (14)$$

将(13)式代入(14)式的右边, 利用(7)式得到(8)式.

在(8)式中, 取  $a=2p, b=p$  得到(9)式; 在(8)式中, 取  $a=p, b=0$  得到(10)式; 在(8)式中, 取  $a=0, b=-p$  得到(11)式.

以下分两种情况证明(8)式中的常数是最佳的.

1) 若  $\Omega = \mathbb{R}^{2n+1}$ , 对于任意  $\varepsilon > 0$ , 取  $C_{\varepsilon} := (C + \varepsilon)^{-1}$ , 令

$$u(d) := \begin{cases} C_{\varepsilon} & \xi \in B_1(\xi) \\ C_{\varepsilon} d^{-C-\varepsilon} & \xi \in \Omega \setminus B_1(\xi) \end{cases}$$

计算可以得到

$$\nabla_L u(d) = \begin{cases} 0 & \xi \in B_1(\xi) \\ -d^{-\frac{Q-a+p}{p}-\varepsilon} \nabla_L d & \xi \in \Omega \setminus B_1(\xi) \end{cases}$$

从而有

$$\begin{aligned} \int_{\Omega} |u|^p \frac{|\nabla_L d|^b}{d^a} d\xi &= |C_{\varepsilon}|^p \left( \int_{B_1(\xi)} \frac{|\nabla_L d|^b}{d^a} d\xi + \int_{\Omega \setminus B_1(\xi)} \frac{|\nabla_L d|^b}{d^{Q+p\varepsilon}} d\xi \right) = \\ &= |C_{\varepsilon}|^p \left( \int_{B_1(\xi)} \frac{|\nabla_L d|^b}{d^a} d\xi + \int_{\Omega \setminus B_1(\xi)} |\nabla_L d|^{b-p} |d^{-\frac{Q-a+p}{p}-\varepsilon} \nabla_L d|^p d^{p-a} d\xi \right) = \\ &= |C_{\varepsilon}|^p \left( \int_{B_1(\xi)} \frac{|\nabla_L d|^b}{d^a} d\xi + \int_{B_1(\xi)} |\nabla_L u|^p |\nabla_L d|^{b-p} d^{p-a} d\xi \right) \end{aligned}$$

进一步取  $\varepsilon \rightarrow 0$ , 得到(8)式中的常数是最佳的, 从而(9), (10)式及(11)式中的常数也是最佳的.

2) 若  $\Omega \subset \mathbb{R}^{2n+1}$ , 已知(8)式中的常数可表示为

$$C_{\inf}(\Omega) = \inf \left\{ \frac{\int_{\Omega} |\nabla_L d|^{b-p} \frac{|\nabla_L u|^p}{d^{a-p}} d\xi}{\int_{\Omega} |\nabla_L d|^b \frac{|u|^p}{d^a} d\xi}, u \in C_0^{\infty}(\Omega), u \neq 0 \right\}$$

由于(8)式在(5)式的伸缩  $\delta_R$  下不变, 所以对于  $R > 0$ , 有

$$C_{\inf}(B_R(\xi)) = C_{\inf}(B_1(\xi))$$

因此, 当  $B_R(\xi) \subset \Omega \subset \mathbb{R}^{2n+1}$ , 有

$$|C|^p = C_{\inf}(\mathbb{R}^{2n+1}) \leq C_{\inf}(\Omega) \leq C_{\inf}(B_R(\xi)) = C_{\inf}(B_1(\xi)) \quad (15)$$

如果取  $\phi \in C_0^{\infty}(\mathbb{R}^{2n+1})$ ,  $\Omega = B_R(\xi)$ , 由  $\phi$  的紧性知道(8)式仍然成立. 考虑到当  $R$  足够大时, 以及

$$C_{\inf}(B_R(\xi)) = C_{\inf}(B_1(\xi))$$

可得

$$C_{\inf}(B_1(\xi)) \leq C_{\inf}(\mathbb{R}^{2n+1})$$

结合(15)式, 得到(8)式中的常数是最佳的, 从而(9), (10)及(11)式中的常数也是最佳的.

**注 1** 在(8)式中取  $\Omega = \mathbb{R}^{2n+1}$ ,  $a=p, b=p$  时, 得到(1)式, 且  $p$  的取值范围较文献[5]中结果宽泛.

**注 2** 在(8)式中取  $a=p, b=p$  时, 得到(2)式.

### 3 一类带有余项的含权 Hardy 不等式

**定理 1** 若  $1 < p < \infty$ ,  $\alpha \neq Q$ ,  $\beta > 2 - Q$ ,  $a, b \in \mathbb{R}$ , 则对于  $u \in C_0^{\infty}(\Omega \setminus \{0\})$ ,  $R \geq R_0$ , 有

$$\begin{aligned}
& \int_{\Omega} \left( \frac{|z|}{d} \right)^{(\beta-p)(2k-1)} \left( 1 + \frac{a}{\ln\left(\frac{R}{d}\right)} + \frac{b}{\left(\ln\left(\frac{R}{d}\right)\right)^2} \right) \frac{|\nabla_L u|^p}{d^{a-p}} d\xi \geq \\
& \left| \frac{Q-\alpha}{p} \right|^p \int_{\Omega} \left( \frac{|z|}{d} \right)^{\beta(2k-1)} \frac{|u|^p}{d^a} d\xi + a \left| \frac{Q-\alpha}{p} \right|^p \int_{\Omega} \left( \frac{|z|}{d} \right)^{\beta(2k-1)} \frac{|u|^p}{d^a \ln\left(\frac{R}{d}\right)} d\xi + \\
& \left( \frac{p-1}{2p} + a \frac{Q-\alpha}{p} + b \left| \frac{Q-\alpha}{p} \right|^2 \right) \left| \frac{Q-\alpha}{p} \right|^{p-2} \int_{\Omega} \left( \frac{|z|}{d} \right)^{\beta(2k-1)} \frac{|u|^p}{d^a \left(\ln\left(\frac{R}{d}\right)\right)^2} d\xi
\end{aligned} \quad (16)$$

特别地, 在(16)式中取  $a=b=0$ , 有下列带有余项的含权 Hardy 不等式

$$\begin{aligned}
& \int_{\Omega} \left( \frac{|z|}{d} \right)^{(\beta-p)(2k-1)} \frac{|\nabla_L u|^p}{d^{a-p}} d\xi \geq \left| \frac{Q-\alpha}{p} \right|^p \int_{\Omega} \left( \frac{|z|}{d} \right)^{\beta(2k-1)} \frac{|u|^p}{d^a} d\xi + \\
& \frac{p-1}{2p} \left| \frac{Q-\alpha}{p} \right|^{p-2} \int_{\Omega} \left( \frac{|z|}{d} \right)^{\beta(2k-1)} \frac{|u|^p}{d^a \left(\ln\left(\frac{R}{d}\right)\right)^2} d\xi
\end{aligned} \quad (17)$$

证 为方便证明(16)式成立, 首先令

$$\Lambda_0 = \Lambda_0(\eta) = 1 + a\eta\left(\frac{d}{R}\right) + b\eta^2\left(\frac{d}{R}\right)$$

$$\Lambda_1 = \Lambda_1(\eta) = 1 + \left(a + \frac{p-1}{pA}\right)\eta\left(\frac{d}{R}\right) + b\eta^2\left(\frac{d}{R}\right)$$

$$\Lambda_2 = \Lambda_2(\eta) = \frac{d\Lambda_1}{d\eta} = \left(a + \frac{p-1}{pA}\right)\eta^2\left(\frac{d}{R}\right) + 2b\eta^3\left(\frac{d}{R}\right)$$

其中  $\eta(s) = -\frac{1}{\ln s}$ ,  $s \in (0, 1)$ ,  $A = \frac{Q-\alpha}{p}$ . 这样, 当  $\sup_{\xi \in \Omega} d(\xi) < R$ ,  $\xi \in \Omega$  时, 就会存在常数  $M > 0$ , 使得

$$0 \leq \eta\left(\frac{d(\xi)}{R}\right) \leq M$$

从而当  $R$  足够大时, 在  $\Omega$  上有  $\Lambda_0 > 0$ ,  $\Lambda_1 > 0$ .

若  $T_1(s) = pA\Lambda_1(s) + \Lambda_2(s) = pA\left(1 + \left(a + \frac{p-1}{pA}\right)s + bs^2\right) + \left(a + \frac{p-1}{pA}\right)s^2 + 2bs^3$ , 则

$$T_1(s) = pA + pA\left(a + \frac{p-1}{pA}\right)s + \left(pAb + a + \frac{p-1}{pA}\right)s^2 + 2bs^3 \quad (18)$$

若  $T_2(s) = (1 + as + bs^2)^{-\frac{1}{p-1}}$ , 则  $T_2(s)$  在  $s=0$  处的 Taylor 展开式为

$$T_2(s) = 1 - \frac{a}{p-1}s + \frac{1}{2}\left(\frac{pa^2}{(p-1)^2} - \frac{2b}{p-1}\right)s^2 + O(s^3) \quad (19)$$

若  $T_3(s) = \left(1 + \left(a + \frac{p-1}{pA}\right)s + bs^2\right)^{\frac{p}{p-1}}$ , 则  $T_3(s)$  在  $s=0$  处的 Taylor 展开式为

$$T_3(s) = 1 + \frac{p}{p-1}\left(a + \frac{p-1}{pA}\right)s + \frac{1}{2}\left(\frac{p}{(p-1)^2}\left(a + \frac{p-1}{pA}\right)^2 + \frac{2bp}{p-1}\right)s^2 + O(s^3) \quad (20)$$

利用(18), (19)及(20)式, 得到

$$\begin{aligned}
& T_1(s) - (p-1)AT_2(s)T_3(s) = pA + pA\left(a + \frac{p-1}{pA}\right)s + \left(pAb + a + \frac{p-1}{pA}\right)s^2 + 2bs^3 - \\
& (p-1)A\left[1 - \frac{a}{p-1}s + \frac{1}{2}\left(\frac{pa^2}{(p-1)^2} - \frac{2b}{p-1}\right)s^2 + O(s^3)\right] \times
\end{aligned}$$

$$\begin{aligned}
& \left[ 1 + \frac{p}{p-1} \left( a + \frac{p-1}{pA} \right) s + \frac{1}{2} \left( \frac{p}{(p-1)^2} \left( a + \frac{p-1}{pA} \right)^2 + \frac{2bp}{p-1} \right) s^2 + O(s^3) \right] = \\
& pA + pA \left( a + \frac{p-1}{pA} \right) s + \left( pAb + a + \frac{p-1}{pA} \right) s^2 - \\
& (p-1)A \left( 1 + \left( a + \frac{1}{A} \right) s + \left( \frac{1}{2pA^2} + b \right) s^2 \right) + O(s^3) = \\
& A + Aas + \left( \frac{p-1}{2pA} + a + Ab \right) s^2 + O(s^3) \tag{21}
\end{aligned}$$

取  $H = A |A|^{\rho-2} \frac{|\nabla_L d|^{\beta-2} \nabla_L d}{d^{\alpha-1}} \Lambda_1$ , 有

$$\begin{aligned}
& \operatorname{div}_L H - (p-1) |\nabla_L d|^{\frac{\beta-p}{p-1}} d^{\frac{\alpha-p}{p-1}} \Lambda_0^{-\frac{1}{p-1}} |H|^{\frac{p}{p-1}} = \\
& A |A|^{\rho-2} ((Q-\alpha)\Lambda_1 + \Lambda_2) d^{-\alpha} |\nabla_L d|^{\beta} - (p-1) |A|^{\rho} \Lambda_0^{-\frac{1}{p-1}} \Lambda_1^{\frac{p}{p-1}} d^{-\alpha} |\nabla_L d|^{\beta} = \\
& A |A|^{\rho-2} d^{-\alpha} |\nabla_L d|^{\beta} (pA\Lambda_1 + \Lambda_2 - (p-1)A\Lambda_0^{-\frac{1}{p-1}} \Lambda_1^{\frac{p}{p-1}}) \tag{22}
\end{aligned}$$

通过(21), (22) 式, 得到

$$\begin{aligned}
& \operatorname{div}_L H - (p-1) |\nabla_L d|^{\frac{\beta-p}{p-1}} d^{\frac{\alpha-p}{p-1}} \Lambda_0^{-\frac{1}{p-1}} |H|^{\frac{p}{p-1}} \geq \\
& |A|^{\rho} \left( 1 + a\eta \left( \frac{d}{R} \right) + \left( \frac{p-1}{2p|A|^2} + aA^{-1} + b \right) \eta^2 \left( \frac{d}{R} \right) \right) d^{-\alpha} |\nabla_L d|^{\beta} \tag{23}
\end{aligned}$$

又由于

$$\begin{aligned}
& \int_{\Omega} \operatorname{div}_L H |u|^{\rho} d\xi = -p \int_{\Omega} \langle H, \nabla_L u \rangle |u|^{\rho-2} u d\xi \leq p \int_{\Omega} |H| |\nabla_L u| |u|^{\rho-1} d\xi \leq \\
& p \left( \int_{\Omega} \frac{|\nabla_L d|^{\beta-p}}{d^{\alpha-p}} \Lambda_0 |\nabla_L u|^{\rho} d\xi \right)^{\frac{1}{p}} \left( \int_{\Omega} \left( \frac{|\nabla_L d|^{\beta-p}}{d^{\alpha-p}} \right)^{-\frac{1}{p-1}} \Lambda_0^{-\frac{1}{p-1}} |u|^{\rho} |H|^{\frac{p}{p-1}} d\xi \right)^{\frac{\rho-1}{p}} \leq \\
& p \left( \frac{1}{p} \int_{\Omega} \frac{|\nabla_L d|^{\beta-p}}{d^{\alpha-p}} \Lambda_0 |\nabla_L u|^{\rho} d\xi + \frac{p-1}{p} \int_{\Omega} |\nabla_L d|^{\frac{\beta-p}{p-1}} d^{\frac{\alpha-p}{p-1}} \Lambda_0^{-\frac{1}{p-1}} |H|^{\frac{p}{p-1}} |u|^{\rho} d\xi \right) \leq \\
& \int_{\Omega} \frac{|\nabla_L d|^{\beta-p}}{d^{\alpha-p}} \Lambda_0 |\nabla_L u|^{\rho} d\xi + (p-1) \int_{\Omega} |\nabla_L d|^{\frac{\beta-p}{p-1}} d^{\frac{\alpha-p}{p-1}} \Lambda_0^{-\frac{1}{p-1}} |H|^{\frac{p}{p-1}} |u|^{\rho} d\xi
\end{aligned}$$

也即

$$\begin{aligned}
& \int_{\Omega} \frac{|\nabla_L d|^{\beta-p}}{d^{\alpha-p}} \Lambda_0 |\nabla_L u|^{\rho} d\xi \geq \\
& \int_{\Omega} (\operatorname{div}_L H - (p-1) |\nabla_L d|^{\frac{\beta-p}{p-1}} d^{\frac{\alpha-p}{p-1}} \Lambda_0^{-\frac{1}{p-1}} |H|^{\frac{p}{p-1}}) |u|^{\rho} d\xi \tag{24}
\end{aligned}$$

将(23) 式代入(24) 式, 利用(7) 式, 得到(16) 式.

**注 1** 在(17) 式中取  $k=1$ ,  $\alpha=p$ ,  $\beta=p$  时, 得到(3) 式.
